ICAR-NRCP Newsletter

(January to June 2021)

From the Director's Desk

Dear Readers,

It is a pleasure for me to present you the ICAR-NRCP newsletter for January-June, 2021. It portrays the centre's major research achievements, activities and events that happened over the past six months. It is proud moment for us that, national level DUS (Distinctiveness, Uniformity and Stability) centre exclusively for the pomegranate has been established at NRCP, Solapur. Many scientists from this centre are awarded with prestigious fellowships and awards. Centre continued as capacity building by organizing training programmes for farmers, state officials and entrepreneurs.

The DUS examination helps in preventing unauthorized use and this centre will help in pomegranate variety protection, new variety identification, will help to prevent mislabelling or misleading of pomegranate varieties, will enhance market transparency and will help in conservation of pomegranate plant genetic resources. NRCP released one bio-fortified, high yielding, early maturing pomegranate variety 'Solapur Lal', having high iron, zinc, Vitamin-C and anthocyanin contents in the edible parts. It is a boon to combat nutritional deficiencies in human. Even during continuous rainy days flower drop in this variety was less and good fruit set was recorded.

Editorial Team: Dr. Pinky Raigond, Dr. Somnath S. Pokhare, Dr. Namrata A. Giri

Research achievements/ Highlights/ Technology developed

Solapur Lal: Joint AGRESCO-2021

Solapur Lal is the first bio-fortified pomegranate variety developed by NRCP, Solapur. It has higher yield (23 t/ha), early maturity (160 days), higher total soluble solids (17.6^{o} Brix), Vitamin C (19.2 mg/100g), Anthocyanin (390 mg/100g), etc. This variety exhibit 60% more Iron and 25% more Zinc content over Bhagawa, the ruling variety.

Solapur Lal Fruit

Fruit exposing arils

Arils

(K. Dhinesh Babu)

Establishment of DUS Centre on Pomegranate at ICAR- NRCP, Solapur

On site DUS characterization of farmer variety 'Sharad king' at Tupewadi, Aurangabad has showed the presence of distinctive characteristic features for petal length (long), fruit length (long), aril length (short) and fruit maturity (medium) in comparison to 'Bhagawa' (medium, medium, medium, and late maturity, respectively). It is found susceptible to bacterial blight disease. The two years consolidated report of the two hybrid varieties (NRCP H-4 and NRCP H-14) has showed that the NRCP H-14 is having vigorous plant growth habit with yellow with red tinge fruits, very sweet pink arils and hard seeds. While, NRCP H-4 fruit rind is yellow with red tinge, arils are pink with acidic juice embedded with hard seeds. All these are medium duration varieties takes about 140-165 days to mature after anthesis. In 2021, NRCP H-6 (Solapur Lal) and NRCP H-12 (Solapur Anardana) varieties got registered under PPV&FRA, New Delhi as new varieties.

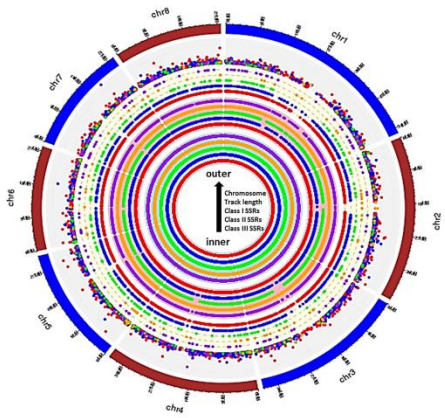
Development of chromosome specific hyper variable SSR markers for large-scale genotyping applications in Pomegranate

DNA marker technology facilitates the identification of genetic determinants (genes/QTLs) underlying various traits of economic significance, and SSR markers represent one of the most informative, abundant, and easy-to-use marker systems for genetic studies and plant breeding programs. However, paucity of highly polymorphic chromosome-specific molecular markers in pomegranate has hampered map-based gene/QTL analysis. Availability of chromosome-level genome assembly of the pomegranate cultivar such as 'Tunisia' (296.85 Mb, Luo et al., 2019) provided us with unprecedented opportunity for genome-wide characterization and development of the first set of chromosome-specific highly informative 3,839 hypervariable SSR markers (tract length > 30 nt). Considering the significance of SSRs with greater tract length with higher degree of polymorphism for genetic analysis in other crops, here, we designed and validated 3,839 class I SSRs in the 'Tunisia' genome through ePCR and found 1,165 (30.34%) SSRs producing a single amplicon. Then, we selected 906 highly variable SSRs (> 40 nt) from the ePCR-verified class I SSRs and *in silico* validated across multiple draft genomes of pomegranate, which provided us a subset of 265 highly polymorphic SSRs. Of these, 235 primers were got synthesized and validated on six pomegranate genotypes through wet-lab experiment. We found 221 (94%) polymorphic SSRs on six genotypes and 187 of these SSRs had ≥ 0.5 PIC values. The utility of the developed SSRs was demonstrated by analyzing genetic diversity of 30 pomegranate genotypes using 16 HvSSRTs spanning eight pomegranate chromosomes.



Chromosome wise distribution of SSR motifs and their tract lengths

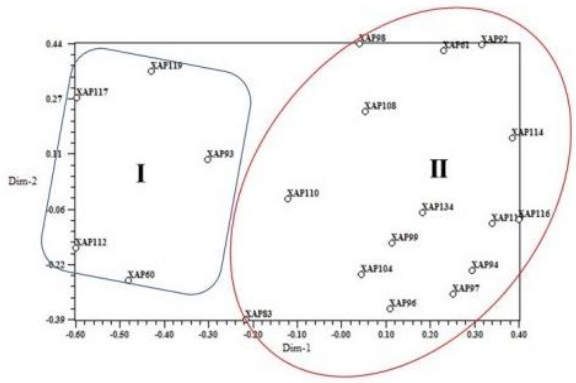
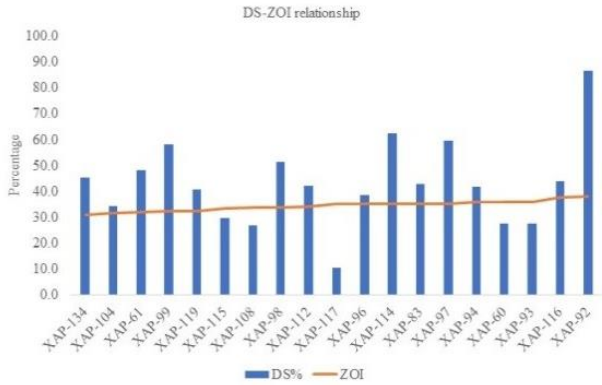
Genetic Diversity and Streptomycin Sensitivity in *Xanthomonas axonopodis* pv. *punicae* Causing Oily Spot Disease in Pomegranates

Xanthomonas axonopodis pv. *punicae* (Xap) causes bacterial blight disease in pomegranates, often leading to 60–80% economic loss. In absence of a suitable Xap-resistant variety, the near monoculture of the susceptible variety, Bhagwa, has aggravated the problem further. In recent times, Xap has spread to different geographical regions, indicating the wide adaptability of the pathogen. Moreover, lower sensitivity of Xap towards streptocycline containing streptomycin sulphate and tetracycline sulphate (9:1) under field conditions is frequently reported. Therefore, the current study

was undertaken to assess the genetic variability of Xap isolates using SSR markers, their *in vitro* sensitivity towards streptomycin was evaluated, and the probable molecular basis of acquired resistance was studied. Two highly diverse isolates showed extreme differences in their pathogenicity, indicating the highly evolving nature of the pathogen. Moreover, all the isolates showed less than 50% growth inhibition on media containing 1500 µg/mL streptomycin, indicating a lower level of antibiotic sensitivity. On the molecular level, 90% of the isolates showed the presence of strA-strB genes involved in streptomycin metabolism. Additionally, G to A transitions were observed in the rpsL gene in some of the isolates. The molecular data suggest that horizontal gene transfer (strAB) and/or spontaneous gene mutation (in rpsL) could be responsible for the observed lower sensitivity of Xap towards streptomycin.



Grouping of Xap isolates based on their genetic diversity as analysed by SSR markers



Relationship between percent disease severity (%DS), observed after 6 weeks, and zone of inhibition (ZOI) at the highest concentration (1500µg/mL) of antibiotic

Low Calorie Pomegranate Fruit Drink

Low-calorie drinks are promoted as healthy alternatives to sugar-sweetened beverages. Free or added sugars have been acknowledged as a readily available source of energy, which accounts for a large percentage of daily energy intakes, leading to excess calories, weight gain and obesity. The use of natural and artificial sweeteners has been optimized for the development of low calorie pomegranate fruit drink. It was prepared using natural (stevia) and artificial sweeteners (sucralose and aspartame) by substituting sucrose (refined sugar) at the rate of 0, 25%, 50%, 75% and 100%. The total sugar content of beverage was significantly reduced from 15.03% to 4.5% due to use of non-calorific sweeteners. The energy value was also reduced from 60.12 kcal/100ml to 18 kcal/100ml. The sensory evaluation resulted in higher panel score to the beverage containing 75% stevia and 25% sucrose when compared to the beverage prepared using sucralose and aspartame sweeteners. The developed beverage is suitable for the consumers on low calorie diet and also for patient with type-II diabetes.

International Women's Day Celebration

On March 8, 2021 the International women's day virtual conference was attended by all the staff of ICAR - NRC on Pomegranate from their respective rooms and labs. After the completion of ICAR virtual International Women's day programme. At ICAR –NRC on Pomegranate, Solapur celebrated International Women's day, The programme inaugural session started at 12:30 pm. Smt. Priyamvada, Managing Director, The Solapur Chemicals Pvt Ltd. Guest of Honour, Dt. Sapana Dodmani-Pawar, Dietician and Dr. Jyotsana Sharma, Director (Acting) ICAR –NRCP, Solapur inaugurated the program by lighting lamp followed by ICAR song. There were two keynote address, one on Role of women in entrepreneurship by Mrs Priyamvada H Godbole (Chief guest) and other one on "Food and Nutrition tips for Women Health" delivered by Dt. Sapana Dodmani- Pawar (Guest of Honor). On this occasion we identified four women in different strengths and felicitated during International

Women's day celebration are detailed below.

1. Bhakti Jadhav : Water Body Rejuvenation, Solapur
2. Shobha Pawar: Small Scale Producer (Pomegranate Juice), Solapur
3. Laxmi Birajdar, Small Entrepreneur (Millets), Solapur
4. Sunita Habbu, Value addition in Millets, Solapur

Felicitation to Women for their value Contribution in the field of Agriculture and Celebrations at ICAR –NRC on Pomegranate, Solapur on March 08, 2021

Activities under Swacchata Abhiyan

The swachhta abhiyan was conducted at ICAR-NRC on Pomegranate, Solapur, Maharashtra to create awareness among the society. Coconut, Mangos plantations were conducted at Hiraj research field ICAR-NRCP. Building premises, laboratories, library, guest house and research field were cleaned with the active involvement of ICAR-NRCP staff. The public places were cleaned with awareness among the people and dustbins also given to the public places like temple and residential areas. Swachhta activity was also conducted at Jaloli Ta. Pandharpur Dist. Solapur with the compost making demonstration to the villagers. The debate competition and drawing competitions were conducted at Shree Sharadchandra Patil School, Solapur in order to create awareness and importance of the cleanliness.

DARE-ICAR SIGNIFICANT ACHEVEMENTS 2014-2021

A. Horticultural Crops

- New and improved varieties and hybrids of horticultural crops have played pivotal role in augmenting the production of fruits and vegetables for nutrition and income augmentation. In horticultural crops, 418 varieties were developed during 2014-21 to supplement nutrition and income security against only 268 during 2007-14. These varieties also included processable varieties of tomato, onion and potato as well as biofortified varieties.

Biofortified (Fe 21ppm & Zn50ppm) potato 'Kufri Manik' with 25-30t/ha productivity in Eastern Plains

Okra 'Kashi Lalima' with 140-150 q/ha productivity in 105 days

- Pomegranate variety 'Sholapur Lal' with higher nutrient content identified: It has 23 to 27t/ha productivity with 19.4-19.8 mg/100g Vitamin-C, 385-395 mg/100g Anthocyanin, 5.6 – 6.1 mg/100g iron content in fresh arils.
